I currently have something like let xs = Seq.initInfinite (fun n -> [for i in 1.. n -> [n*i]]) And I need to transform this into a list. I could either go for a doubly infinite nested list, or I could use two lists, one for the elements (in square brackets) and one for the indices (in curly brackets). Here's how I'd do the latter: let xs = Seq.initInfinite (fun n -> Seq.initInfinite (fun j -> Seq.initInfinite (fun i -> [n*i; j]))) This works but it's somewhat ugly. It's very repetitive, and I don't like the use of Seq.initInfinite. Is there a better way? A: There is a bit more sensible solution, which is used in System.Linq classes. List.initInfinite() returns a boxed F# list, which makes binding them to List or Seq impossible. To use List or Seq we should use F# functions (fst, snd), which are not tail-recursive: let i = Seq.initInfinite (fun n -> Seq.initInfinite (fun j -> Seq.initInfinite (fun i -> [n * i; j
